

APPLICATION ENHANCER · SOIL & PLANT LINE

CARBOfol

One jug does the work of three.

REFERENCE RATE

1–1.5 L/ha
☐ Nationally manufactured

☐ Our own functional carbon

☐ Replaces pH buffer and oil

What it is

An application enhancer of functional carbon and organic acids, with over 200 components. It goes into the burndown tank and does three jobs at once: it boosts the active, corrects tank pH and replaces synthetic oil. You stop buying two inputs.

Why it works

Corrects tank pH

An acid tank mix improves the active's stability and uptake in burndown.

Sticking and penetration

Improves the active's sticking and penetration on the weed: more control at the same rate.

Organic matter in the tank

Adds organic matter and organic acids that, being neither toxic nor saline, feed the microbiota instead of punishing it.

Fewer passes

Saving a pass saves machinery, labor and fuel — not just the price of the product.

What to expect

Every figure states its evidence level

-30 %

Active rate at equal control, in forestry burndown

MEASURED RESULT

90 vs 85 %

Burndown at full rate plus CARBOfol, against the active alone

MEASURED RESULT

-50 %

Fungicide and insecticide product on a mixed 6,000 ha system

MEASURED RESULT

Where and how to apply

SYSTEM	RATE	APPLICATION METHOD
Burndown	1–1.5 L/ha	In the tank: water, CARBOfol, the active, FILABIOSA
Forestry burndown	1 L/ha	With FILABIOSA at 2 L/ha, added to the active already in use
Dilution reference	1.5 L / 100 L of water	Per protocol

Tank order: water, CARBOfol, the active, FILABIOSA. CARBOfol boosts the application; soil bioremediation is FILABIOSA's job.

The case behind every figure

Sector, region and scale; never the grower's name

MEASURED RESULT Forestry: 30% less rate at equal control

In eucalyptus burndown, 30% less active achieved the same control, with no pH buffer and no oil. At the full rate plus CARBOfol, burndown reached 90% against 85% for the active alone: it boosts, it does not merely substitute.

MEASURED RESULT Mixed 6,000 ha system: half the crop-protection passes

Soybeans, corn and sorghum in the Chaco: 50% less fungicide and insecticide product, with no synthetic enhancers, and a sorghum crop at 52 t/ha of forage.

Technical data

Base	Functional carbon and organic acids, over 200 components
pH	Acid (2.8–3.1)
Format	Liquid concentrate
Storage	Shaded; shake before opening
Origin	Made in Paraguay
Uses	Burndown and weed control in every crop

Works with

FILABIOSA

Rides in the same tank, last in: it restores the biology burndown costs you.

CARBOfol+

The pH-neutral version, for actives you should not acidify.

GrowBox

The recommended entry point for a first-time customer: application enhancer plus seed treatment.

NEXT STEP

Request a quote or talk to an agronomist

An agronomist replies within 24 business hours. We set the rate and the protocol against your own field's diagnosis.

Before you buy, measure your soil

Soil chromatography sets the baseline and the rate. A result from your own field is a better argument than anyone else's case.
